

Triangular active walker: corrected theory matches KMC; residuals are noise-like

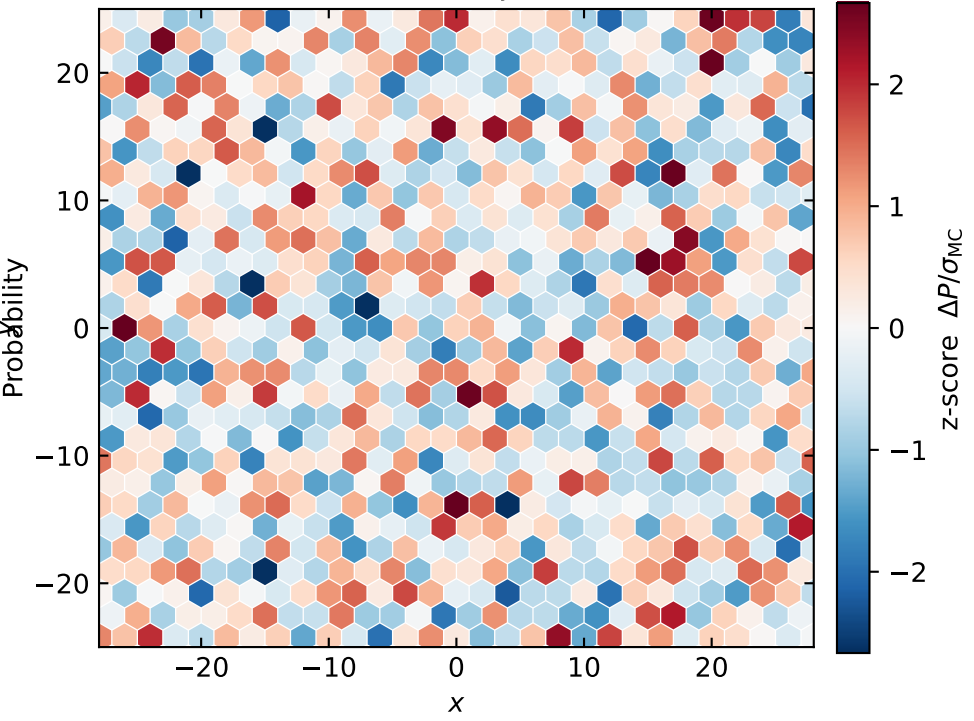

(a) Corrected exact theory ( $\gamma = 0.01$ ,  $\varepsilon = 0.15$ ,  $t = 50$ )

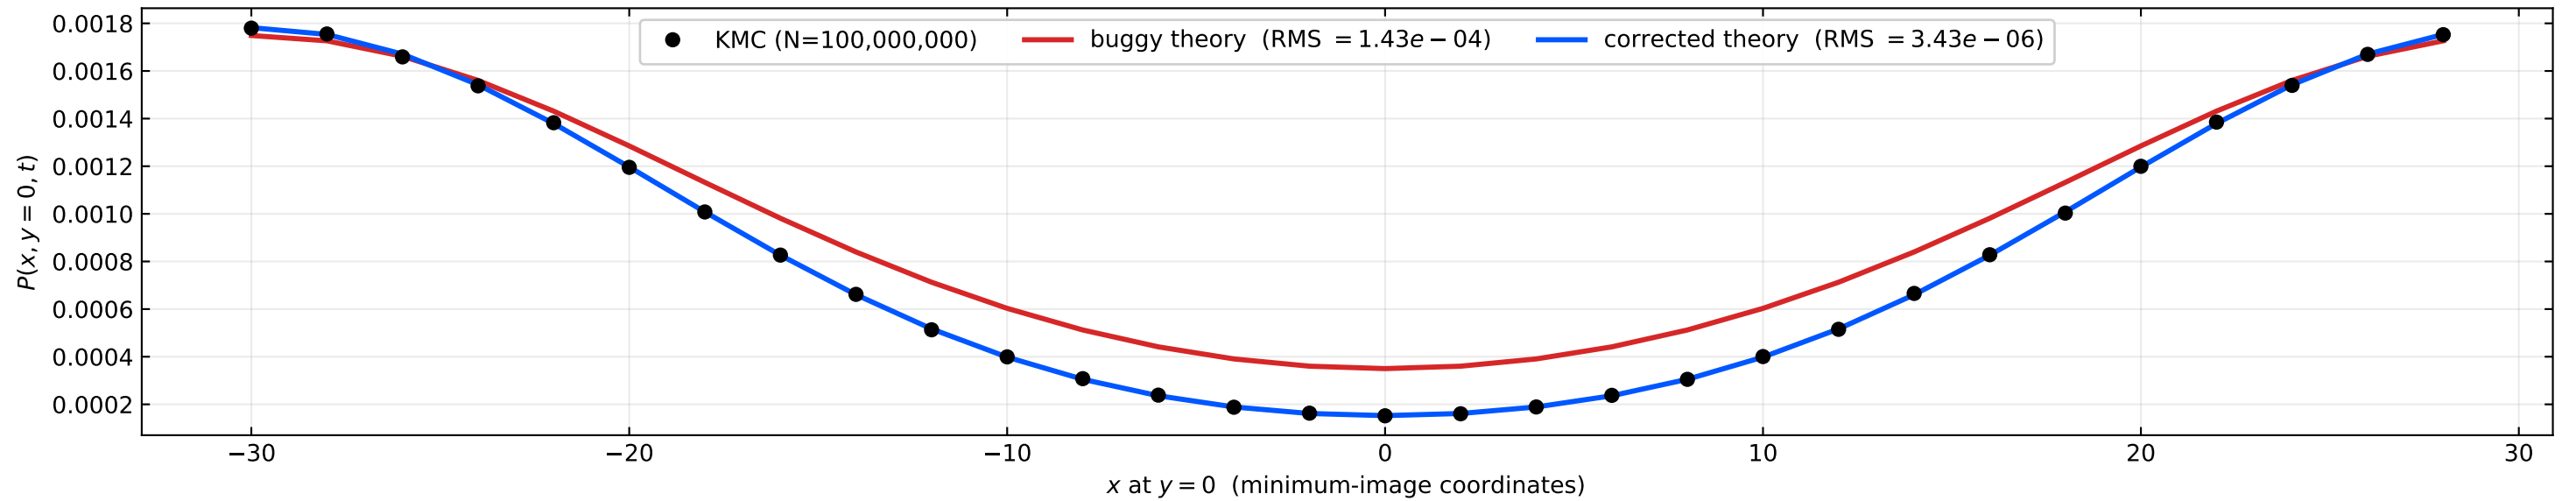

(b) Kinetic Monte Carlo ( $N = 100,000,000$ )

(c) Residual  $(P_{\text{theory}} - P_{\text{KMC}})/\sigma_{\text{MC}}$

(d) Horizontal cross-section through the walker

MC noise floor  $\approx 4.22e-06$ ; corrected theory is at the noise floor. The old  $c_3$  sign gives the red curve.
